

UMAIR ANJUM

WEB Developer — PHP · MVC · Database · Data & Automation

Rawalpindi, Pakistan | +92 333 150 4378 | umairanjum7866@gmail.com | github.com/Clash786

SUMMARY

Generalist full-stack developer who loves programming for its own sake self-taught across backend frameworks, databases, automation, and AI/NLP pipelines, with production systems shipped for international clients. Comfortable moving across the stack: Python (FastAPI), PHP (Laravel), MySQL/PostgreSQL, REST APIs, and Linux/Git-based workflows. Builds real infrastructure end-to-end from ESP32/MQTT hardware integration to Roman Urdu NLP classifiers and enjoys picking up new tools and languages fast. Currently finishing a CS degree while running two independent software ventures alongside client work.

TECHNICAL SKILLS

Languages: PHP, HTML, CSS, JavaScript, C++, Python, SQL

Backend & APIs: FastAPI, Laravel, JWT, REST API design, distributed messaging (MQTT)

Databases: MySQL, PostgreSQL-style relational design, schema design & optimization

Data / ML / NLP: TF-IDF, SVM, mBERT classifiers, data pipelines, AI-assisted development (Claude Code)

Systems & Tooling: Linux, Git/GitHub, n8n workflow automation, cPanel, ESP32/embedded messaging

Frontend: React.js, Flutter, TypeScript, Tailwind CSS

EXPERIENCE

Freelance Full-Stack Developer *Mar 2025 – Present*

- Built and shipped production systems end-to-end for international clients across UAE healthcare and yachting sectors, owning everything from database schema to deployment.
- Designed an automated data pipeline (n8n + Serper.dev API + Google Sheets) that scrapes, enriches, and routes lead data comparable in shape to ETL/data-transformation workflows.
- Built goYachingDubai (Laravel + MySQL) with a custom CMS, dynamic page generation, and SEO-optimized routing.
- Built CosmocareMedicalCenter, a multilingual React + Laravel/PHP site with server-level routing and localization logic.

KEY PROJECTS

FuelFlow — IoT Petrol Pump Management System (Final Year Project)

- Backend built in Laravel + FastAPI + MySQL, serving a dual-platform React/Flutter client.
- Integrated ESP32 hardware over MQTT for real-time telemetry ingestion and push-notification alerts — hands-on experience with distributed, message-driven data flow under real hardware constraints.

USTAAD — AI-Powered Hyperlocal Service Marketplace

- Built a Roman Urdu NLP classification pipeline (TF-IDF + SVM + mBERT) to match informal-sector workers to customer requests — independent data science work outside formal coursework.
- Designed the backend (Laravel REST API + MySQL) and Flutter client from scratch as a solo technical lead.

EDUCATION

BS Computer Science — FUUAST Islamabad

2023 – 2027 (Final Year) | GPA 3.3/4.0

WHY I BUILD

Programming is a habit outside of client work, not just for it — from wiring up embedded hardware over MQTT, to training NLP classifiers on Roman Urdu text, to using AI coding tools to move faster and explore ideas I wouldn't otherwise have time for. Currently building two independent ventures (FuelFlow, USTAAD) solo, end-to-end.
